School Recommendations

Before Kindergarten

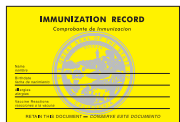

Polio, DTaP, and MMR #2.  
Also, HepB series and Varicella, unless already given.

Before 7<sup>th</sup> Grade

Meningitis vaccine and Tdap booster.

6-23 months and high-risk kids

Every Fall: Flu Vaccine

**CALIFORNIA KIDS**  
**Love them. Immunize them.**

This is a suggested schedule. For alternatives and details, consult the latest "Recommended Childhood Immunization Schedule, United States."

\* HepB series also can be started at birth, the second dose given at 1-2 months, and the third dose at 6-12 months. If using Comvax<sup>®</sup> (combined Hib and HepB vaccine), the third dose should be given at 12 months, not 6 months.

† This dose can be skipped if Pedvax HIB<sup>®</sup> and/or Comvax<sup>®</sup> (combined Hib and HepB vaccine) are used exclusively for the infant doses.
